1 Improved MitM Attack on Ascon-XOF

For practical attacks on Ascon, we also apply our tools on Ascon-XOF with 64-bit hash in two tweaked settings given by the designers of Ascon [1]. In the setting of equivalent IV=0 and and one 64-bit word, we reduce time of the 2-round preimage attack from 2^{39} [1] to $2^{33.16}$, and also achieve the first 3-round preimage attack with $2^{54.33}$. When increasing to 3-word rate as [1], we reduce the 3-round preimage attack from 2^{48} [1] to 2^{33} , and also achieve the first 4-round preimage attack with $2^{53.59}$. We also give an experiment of 2-round MitM collision attack on Ascon-XOF with 64-bit hash, following the setting given by the designers, i.e., equivalent IV=0 and one 64-bit word rate

For ease of reading, we recall the round function of Ascon, which consists of three operations: constant addition p_C , non-linear Sbox p_S and linear layer p_L . Denote the internal states of round r as $A^{(r)} \xrightarrow{p_S \circ p_C} S^{(r)} \xrightarrow{p_L} A^{(r+1)}$. The Sbox for Ascon maps $(a_0, a_1, a_2, a_3, a_4) \in \mathbb{F}_2^5$ to $(b_0, b_1, b_2, b_3, b_4) \in \mathbb{F}_2^5$, and the algebraic normal form (ANF) of the Sbox are listed as follows:

$$b_0 = a_4 a_1 + a_3 + a_2 a_1 + a_2 + a_1 a_0 + a_1 + a_0,$$

$$b_1 = a_4 + a_3 a_2 + a_3 a_1 + a_3 + a_2 a_1 + a_2 + a_1 + a_0,$$

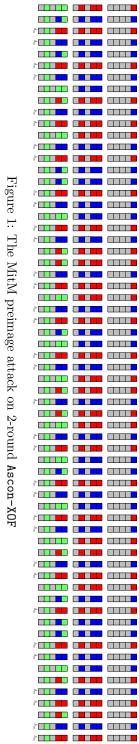

$$b_2 = a_4 a_3 + a_4 + a_2 + a_1 + 1,$$

$$b_3 = a_4 a_0 + a_4 + a_3 a_0 + a_3 + a_2 + a_1 + a_0,$$

$$b_4 = a_4 a_1 + a_4 + a_3 + a_1 a_0 + a_1.$$
(1)

1.1 Improved MitM preimage attack on Ascon-XOF

In the setting with an all-zero equivalent IV and for a rate of 64, we consider the practical MitM preimage attacks on Ascon-XOF with a 64-bit hash value and a 64-bit security claim against preimage attack. The paddings and round constants are also omitted for simplicity as [1]. Applying our automatic tools, we find an improved 2-round preimage attack and the first 3-round preimage attack on Ascon-XOF in this setting.

 $S^{(0)}$

 $A^{(0)}$

1.1.1 Improved MitM preimage attack on 2-round Ascon-XOF

The 2-round MitM preimage attack on Ascon-XOF is given in Figure 1. In the starting state $A^{(0)}$, the 256-bit outer part $\{A^{(0)}_{\{*,1\}},A^{(0)}_{\{*,2\}},A^{(0)}_{\{*,3\}},A^{(0)}_{\{*,4\}}\}$ are all zeros, which are marked by \blacksquare . The 64 bits inner part $A^{(0)}_{\{*,0\}}$ have 32 bits \blacksquare and 32 bits \blacksquare . Then after the first substitution layer p_S , we have

$$\begin{cases}
S_{\{z,0\}}^{(0)} = S_{\{z,1\}}^{(0)} = S_{\{z,3\}}^{(0)} = A_{\{z,0\}}^{(0)}, \\
S_{\{z,2\}}^{(0)} = 1, \\
S_{\{z,4\}}^{(0)} = 0,
\end{cases} \tag{2}$$

where $0 \le z \le 63$. Then after the linear layer p_L , we can get $A^{(1)}$ for matching, where m=34. In the computation from $A^{(0)}$ to $A^{(1)}$, there is no DoF of \blacksquare bits and \blacksquare bits consumed. Therefore, $\text{DoF}_{\mathcal{R}}=32$, $\text{DoF}_{\mathcal{B}}=32$. We use one message block to conduct the MitM attack. The 2-round MitM preimage attack is given in Algorithm 1. A space of 2^{32+32} is traversed to find a 64-bit preimage. The time complexity of steps in Alg. 1 are analyzed below:

- In Line 3, the time complexity is 2^{32} 2-round Ascon.
- In Line 4, the time complexity is 2^{32} 2-round Ascon.
- In Line 6, the time is $2^{32+32-34} = 2^{30}$ 2-round Ascon.

The total time complexity is $2^{32}+2^{32}+2^{30}\approx 2^{33.16}$ 2-round Ascon. The memory is 2^{33} to store L_1 and L_2 .

1.1.2 Improved MitM preimage attack on 3-round Ascon-XOF

In the same setting, we also find the first 3-round attack on Ascon-XOF, as shown in Figure 2. The starting state $A^{(0)}$ have 41 bits \blacksquare and 11 bits \blacksquare . In the computation from $A^{(0)}$ to $A^{(2)}$, the consumed DoFs of \blacksquare are 29 and there is no DoF of \blacksquare consumed. Therefore, DoF_{\mathcal{R}} = 41 - 29 = 12, DoF_{\mathcal{B}} = 11. We have 11-bit matching point in $A^{(2)}$ (m = 11).

The attack procedure is given in Alg. 2, and the time complexities of steps are analyzed below:

- In Line 4, for each of the 2^{41} possible values of \blacksquare bits in $A^{(0)}$, the time is $2^{12+41}=2^{53}$ 3-round Ascon.
- In Line 8, since U stores 41 bits and 11-bit matching point, building L_1 is just to retrieve the values in $U[c_{\mathcal{R}}]$. Assume one table access is about one Sbox application, the time of Line 8 is $2^{12+29+12} \times \frac{1}{192} = 2^{53} \times 2^{-7.58} = 2^{45.42}$ 3-round Ascon.
- In Line 11, the time is $2^{12+29+11} = 2^{52}$ 3-round Ascon.

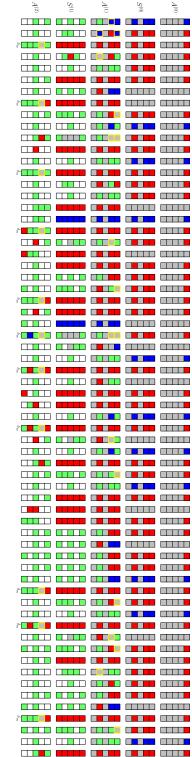

Figure 2: The MitM preimage attack on 3-round Ascon-Y

Algorithm 1: Improved Preimage Attack on 2-round Ascon-XOF

- ${\bf 1}$ Inversely precompute $S^{(1)}_{\{*,0\}}$ with the first 64-bit hashing value
- 2 Compute forward to determine the 34-bit matching point with fixing both and in A⁽⁰⁾ as 0, i.e., compute 34 f_M''' = f_G.
 3 Traversing the 2^{λ_R} = 2³² values for in A⁽⁰⁾ while fixing as 0,
- 3 Traversing the $2^{\lambda_{\mathcal{R}}} = 2^{32}$ values for \blacksquare in $A^{(0)}$ while fixing \blacksquare as 0, compute forward to determine the 34-bit matching point, *i.e.*, compute $34 f'_{\mathcal{M}} = f_{\mathcal{R}} \oplus f_{\mathcal{G}}$. Build the table L_1 and store the 32 bits \blacksquare of $A^{(0)}$, which is indexed by the 34-bit matching point.
- 4 Traversing the $2^{\lambda_{\mathcal{B}}} = 2^{32}$ values for \blacksquare in $A^{(0)}$ while fixing \blacksquare as 0, compute forward to determine the 34-bit matching point, *i.e.*, compute $34 \ f''_{\mathcal{M}} = f_{\mathcal{B}} \oplus f_{\mathcal{G}}$. Build the table L_2 and store the 32 bits \blacksquare of $A^{(0)}$, which is indexed by the 34-bit matching point.
- 5 for values matched between L_1 and L_2 do

```
6 if it leads to the given hash value then
7 Output the preimage
```

8 end

9 end

• In Line 14, the time is $2^{12+29+12+11-11} = 2^{53}$ 3-round Ascon.

The total time complexity is $2^{53}+2^{45.42}+2^{52}+2^{53}\approx 2^{54.33}$ 3-round Ascon. The memory is 2^{41} to store U.

1.2 Improved MitM preimage attack on Ascon-XOF with increased rate

We also consider the attacks on Ascon-XOF, where the rate is increased to the first 3 words as [1]. We target on 3-/4-round Ascon-XOF with a 64-bit hash value and a 64-bit security claim against preimage attack. The equivalent IV is set to 0. For simplicity, the attacks don't consider the constant addition and the paddings.

1.2.1 Improved MitM preimage attack on 3-round Ascon-XOF with 3-word rate

The 3-round MitM preimage attack on Ascon-XOF with 3-block rate is given in Figure 3. In the starting state $A^{(0)}$, we have $A^{(0)}_{\{z,3\}} = A^{(0)}_{\{z,4\}} = 0 (0 \le z \le 63)$, due to the IV=0 which are marked by \blacksquare . Furthermore, we choose an input structure, where $A^{(0)}_{\{z,0\}} = A^{(0)}_{\{z,2\}} + c_z = x_z + c_z$ marked by \blacksquare / \blacksquare and $A^{(0)}_{\{z,1\}} = 0$ marked by \blacksquare . The c_z s are constants and $0 \le z \le 63$. Thus, after the first round of the permutation, we get the following structure as Equ. (3):

Algorithm 2: MitM Preimage Attack on 3-round Ascon-XOF

```
1 Inversely precompute S^{(2)}_{\{*,0\}} with the first 64-bit hashing value
 2 for 2^{12} values of the \blacksquare bits in A^{(0)}
 з do
          Traversing the 2^{\lambda_{\mathcal{R}}} = 2^{41} values for \blacksquare in A^{(0)} while fixing \blacksquare as 0,
 4
            compute forward to determine the 29-bit ■/■ (denoted as
            c_{\mathcal{R}} \in \mathbb{F}_2^{29}), and the 11-bit matching point, i.e., compute 11
            f'_{\mathcal{M}} = f_{\mathcal{R}} \oplus f_{\mathcal{G}}. Build the table U and store the 41-bit \blacksquare of A^{(0)} as
            well as the 11-bit matching point in U[c_{\mathcal{R}}].
          for c_{\mathcal{R}} \in \mathbb{F}_2^{29} do
 5
                Randomly pick a 41-bit \blacksquare e \in U[c_{\mathcal{R}}], and set \blacksquare in A^{(0)} as 0, compute to the matching point to get 11 f'''_{\mathcal{M}} = f_{\mathcal{G}} + Const(e)
 6
                for 2^{12} values in U[c_{\mathcal{R}}] do
 7
                     Restore the values of \blacksquare of A^{(0)} and the corresponding 11-bit
  8
                       matching point (i.e., 11 f_{\mathcal{R}} \oplus f_{\mathcal{G}} = f'_{\mathcal{M}}) in a list L_1 indexed
                        by the matching point
                end
 9
                for 2^{11} values of \blacksquare do
10
                     Set the 41-bit \blacksquare in A^{(0)} as e. Compute to the matching point
11
                       to get 11 \ f''_{\mathcal{M}} = f_{\mathcal{B}} + f_{\mathcal{G}} + Const(e). Together with f'''_{\mathcal{M}}, compute f_{\mathcal{B}} = f''_{\mathcal{M}} + f'''_{\mathcal{M}} and store \blacksquare in L_2 indexed by the
                        11-bit matching point
12
                end
                for values matched between L_1 and L_2 do
13
                     if it leads to the given hash value then
14
                           Output the preimage
15
                     end
16
                \mathbf{end}
17
          end
18
19 end
```

$$\begin{cases}
A_{\{z,0\}}^{(1)} = c_z + c_{z-19} + c_{z-28}, \\
A_{\{z,1\}}^{(1)} = c_z + c_{z-61} + c_{z-39}, \\
A_{\{z,2\}}^{(1)} = x_z + x_{z-1} + x_{z-6} + 1, \\
A_{\{z,3\}}^{(1)} = c_z + c_{z-10} + c_{z-17}, \\
A_{\{z,4\}}^{(1)} = 0,
\end{cases}$$
(3)

where $0 \le z \le 63$ and the computation of z is modular 64. Additional, in the second round, we can add the constraint $A_{\{z,1\}}^{(1)} + A_{\{z,3\}}^{(1)} + 1 = 0$ to make $S_{\{z,1\}}^{(1)}$ to be a constant, since $b_1 = (a_3 + a_1 + 1)a_2 + a_4 + a_3a_1 + a_3 + a_1 + a_0$. Therefore, all $A_{\{z,1\}}^{(2)}$ will be constants and get corresponding matching points.

The starting state $A^{(0)}$ contains $64 \blacksquare$ bits and $64 \blacksquare$ bits. In the computation from $A^{(0)}$ to $A^{(2)}$, the accumulated DoFs of \blacksquare and \blacksquare are both 32 since we set $A^{(0)}_{\{z,2\}} = A^{(0)}_{\{z,0\}} + c_z = x_z + c_z$. Therefore, $\text{DoF}_{\mathcal{B}} = 32$, $\text{DoF}_{\mathcal{R}} = 32$. Totally, we get 64-bit matching point. The attack procedure is given in Alg. 3, and the time complexities of steps are analyzed below:

- In Line 3, the time complexity of computing $f_{\mathcal{M}}^{""}$ is 1 3-round Ascon.
- In Line 5, the time complexity of computing $f'_{\mathcal{M}}$ is 2^{32} 3-round Ascon.
- In Line 8, the time complexity of computing $f''_{\mathcal{M}}$ is 2^{32} 3-round Ascon.
- In Line 11, the time is $2^{32+32-64} = 1$ 3-round Ascon.

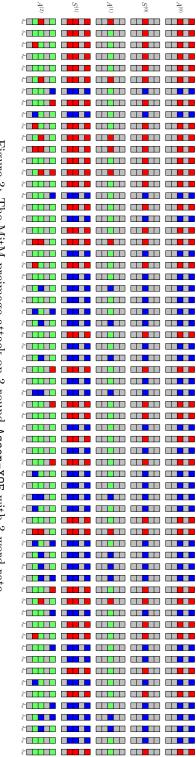

The total time complexity is $2^{32} + 2^{32} + 2 \approx 2^{33}$ 3-round Ascon. The memory is 2^{33} to store L_1 and L_2 .

1.2.2 MitM preimage attack on 4-round Ascon-XOF with 3-word rate

We also find an MITM preimage attack on 4-round Ascon-XOF with 3-word rate as shown in Figure 4. The starting state $A^{(0)}$ contains $12 \blacksquare$ bits and $49 \blacksquare$ bits. In the computation from $A^{(0)}$ to $A^{(3)}$, the accumulated consumed DoF of \blacksquare is 37 and there is no DoF of \blacksquare consumed. Therefore, $DoF_{\mathcal{B}} = 12$, $DoF_{\mathcal{R}} = 49 - 37 = 12$. The details of the attack are given in Alg. 4.

The time complexities of steps in Alg. 4 are analyzed below:

- In Line 5, for each of the 2^{49} possible values of \blacksquare bits in $A^{(0)}$, the time is $2^{3+49} = 2^{52}$ 4-round Ascon.
- In Line 9, since U stores 49 \blacksquare bits and 12-bit matching point, building L_1 is just to retrieve the values in $U[c_{\mathcal{R}}]$. Assume one table access is about one Sbox application, the time of Line 9 is $2^{3+37+12} \times \frac{1}{256} = 2^{52} \times 2^8 = 2^{44}$ 4-round Ascon.
- In Line 12, the time is $2^{3+37+12} = 2^{52}$ 4-round Ascon.

                     if it leads to the given hash value then
15
                          Output the preimage
16
                     end
17
               end
18
          \mathbf{end}
19
20 end
```

• In Line 15, the time is $2^{3+37+12+12-12} = 2^{52}$ 4-round Ascon.

The total time complexity is $2^{52}+2^{44}+2^{52}+2^{52}\approx 2^{53.59}$ 3-round Ascon. The memory is 2^{49} to store U.

1.3 An experiment on 2-round collision attack on Ascon-XOF

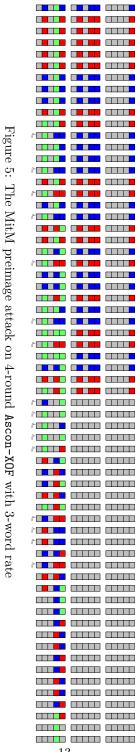

To verify the correctness, we give a collision attack on 2-round Ascon-XOF with 64-bit hash, following the setting given by the designers, i.e., equivalent IV=0 and one 64-bit word rate. The round constants and paddings are also omitted. The attack is shown in Figure 5. $A^{(0)}$ contains 17 \blacksquare and 17 \blacksquare , and there are 16 matching points, where $DoF_{\mathcal{B}} = 17$, $DoF_{\mathcal{R}} = 17$ and m = 16. In the practical attack, we omit the linear layer p_L in the last round for simplicity. That is, we regard $S^{(1)}_{\{*,0\}}$ as the hash value.

Without loss of generality, we set the 16-bit partial target to all-zero. Then we need 2^{24} different M with the same fixed 16-bit partial target. Since each MitM episode can produce 2^{18} partial target preimages, we need repeat 2^6 MitM episodes. The theoretical time is $2^6 \cdot (2^{17} + 2^{17} + 2^{18}) = 2^{25}$, while the time of exhaustive search is 2^{32} .

In each episodes, we traverse the 2^{17} and 2^{17} and set the other 30 bits of $A_{\{*,0\}}^{(0)}$ to be random value. In our practical experiment, when we set the number of MitM episodes to 2^5 , we get 2^{26} partial target preimages. Among them we find one collision. The experiment is very close to our expectation (one collision among the 2^{24} partial target preimages). Testing for several times, we get some collision examples, which are listed in Table 1.
